

FLAG METAMORPHOSES INSTALLATION

www.flag-metamorphoses.net

Technical requirements for screening:

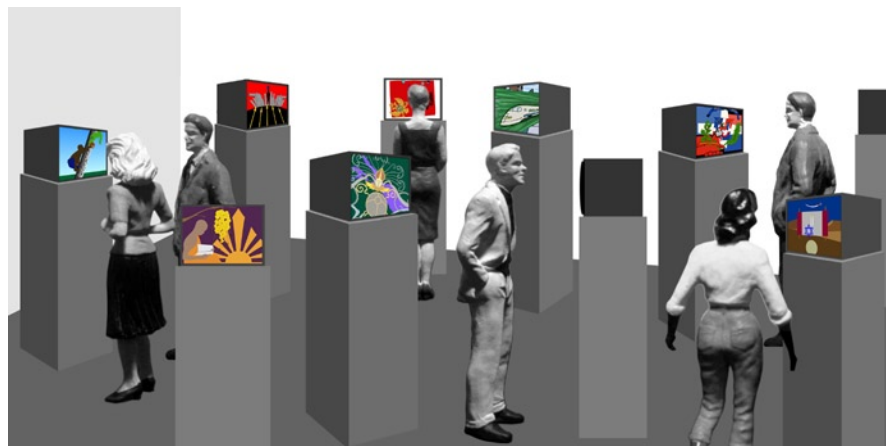

SWF originals require Flash Player 9 (or newer) and a computer with double processor / dual core.

Alternative: The Flash animations are converted to video (DVD, or other digital video formats).

Installation as one large screen

A Flash application with many swf files on a hard drive. Open "flagmetamorphoses.swf" in Flash Player (Stand Alone).

The Flash application will automatically open in full screen / projection mode and show the selection menu.

Devices: Computer with mouse, video projector, two loudspeakers.

Please use devices and cable connections which provide RGB signal, like VGA or DVI. Aspect ratio of the screen: 4:3.

Large projection in a room with no other sounds around (or: headphones instead of loudspeakers).

A socket or small table with the mouse on it (no keyboard!), with short instruction paper.

The computer can for example be installed under / in the socket, or hanging from the ceiling, together with the projector.

The audience can choose the animations from a selection menu. After one animation has played, the menu returns.

Installation with 10 or more monitors on sockets, or 10 or more projections

Devices: 10 or more computers, or media / CF-card players, or DVD players; same number of video projectors and stereo loudspeakers.

10 or more sockets with monitors, or 8-12 projections, looking in different directions.

Each screen shows some of the animations, looping (each animation is shown on one screen only).

The sounds are played low in order not to disturb each other (or: headphones).

The spectators will see several animations at the same time. Remaining in front of each screen for some minutes (until the loop re-starts), they can watch all animations.
